

Research the most compatible backend language/framework that works well with MongoDB.

This should also be open source and free.

- What are its pros and cons?
- How easy is their integration
- What frontend framework can it integrate with easily?

I think Node.JS is suitable for MongoDB database.

**Pros:**

1. By using the mongoose object model tool, Node.JS can make it easier to operate the MongoDB database.
2. On this basis, mongoose is built on MongoDB and provides Schema, Model and Document objects, which is more convenient to use.
3. It can be executed in an asynchronous environment, and the libraries that most scenarios depend on can be found on NPM.

**Cons:**

1. Use node JS debugging is difficult. Without stack trace, it is difficult to find the cause of the problem.

For Mongoose, it is a Node.JS driver of MongoDB developed based on node MongoDB native. And it can be well integrated with the Express framework.
